**Abstract:** It is shown in this paper by a constructive method that for any Lebesgue integrable functions defined on a compact set in a multidimensional Euclidian space, the function and its derivatives can be simultaneously approximated by a neural network with one hidden layer. This approach naturally yields the design of the hidden layer and the convergence rate. The obtained results describe the relationship between the rate of convergence of networks and the numbers of units of the hidden layer, and generalize some known density results in uniform measure.

**Key words:** neural network; simultaneous approximation; hidden layer design; rate of convergence; Lebesgue measure

## 1 Introduction

Various problems concerning the applications of neural networks in many different disciplines can be converted into the problems of approximation multivariate functions by superposition of neural activation function of the networks. Typically, a neural network with one hidden layer is expressed mathematically as

$$N(x) = \sum_{j=1}^m c_j \varphi(\langle w_j \cdot x \rangle + \theta_j), \quad x \in R^s, \quad s \geq 1 \quad (1.1)$$

where  $\theta_j \in R$  is the thresholds,  $\langle w_j \cdot x \rangle$  inner product of  $x$  and  $w_j$ ,  $w_j \in R^s$  connection weights,  $c_j \in R$  coefficients, and  $\varphi$  is the neural activation function of the network. Approximating multivariate functions by networks in Eq.(1.1) has been widely studied in recent years with various results, concerning density or complexity, established for different situations, for instance, by Cybenko<sup>[1]</sup>, Hornik<sup>[2]</sup>, Anastassiou<sup>[3]</sup>, Leshno *et al.*<sup>[4]</sup>, Chui *et al.*<sup>[5]</sup>, Chen<sup>[6,7]</sup>, Li<sup>[8]</sup>, Cao and Xu<sup>[9]</sup> and many others.

Simultaneous approximation of multivariate continuous functions and their partial derivatives on compact sets was also studied in Refs.[8,10,11]. In particular, Li<sup>[8]</sup> used a constructive method based on the multivariate Bernstein operator and gave a density result on uniform simultaneous approximation of multivariate functions and their derivatives by neural network. All the results for simultaneous approximation, however, only concerned about the density in uniform measure. These results therefore contribute almost nothing to answering such important question as how many hidden-layer units are needed to approximate specific functions within certain specified error. On the other hand, it is well known that the  $L^p$  norm to measure the quality of approximation has a penetrating background in engineering, physics, etc.

In this paper, we will address the investigation for simultaneous approximation by neural networks with one hidden layer in Lebesgue measure. Our main result will describe the relationship between the rate of convergence of networks and the number of hidden layer nodes when the approximated functions are the Lipschitz functions, which is different from the results of Refs.[8,10,11]. Furthermore, our approach is constructive, mainly based on the elementary Taylor expansion and the multivariate Bernstein-Durrmeyer operator (a modification of the Bernstein operator), which is much more realizable in computations.

## 2 Simultaneous Approximation by Univariate Polynomials

To facilitate the following discussion, we assume that  $r$  is a fixed integer, and let

$$H_r(x) = a_0 + a_1 x + \dots + a_r x^r \quad (2.1)$$

denote the univariate polynomial of degree  $r$  defined on  $[a, b]$ , where  $a_i \in R$ . In this part, we will study the simultaneous approximation of  $H_r$  and its derivatives by networks.

**Theorem 2.1.** Let  $S$  be a compact subset of  $R^s, s \geq 1$ . Also, let  $\varphi^{(m+1)} \in C(R), m \in N, \varphi^{(i)}$  bounded on  $R$ , and there exists a  $\theta \in R$  such that  $\varphi^{(i)}(\theta) \neq 0$  for  $1 \leq i \leq m+1$ .  $H_r(x)$  is a univariate polynomial given in (2.1), and  $0 \leq m \leq r$ . Then for any  $\varepsilon > 0$ , we can construct a neural network with one hidden layer, one input and

$(r-m+1)$  units in the hidden layer:  $N_n(x) = \sum_{i=1}^n c_i \varphi(\omega_i x + \theta)$ ,  $c_i, \omega_i \in R$ ,  $n = r-m+1$ , such that

$$\|N_n^{(m)} - H_r^{(m)}\|_p < \varepsilon, \quad 1 \leq p \leq \infty.$$

*Proof.* Let  $N_n(x) = \sum_{j=1}^n c_j \varphi(\omega_j x + \theta)$ ,  $c_j, \omega_j \in R$ , then we can choose some appropriate  $c_i$ , and  $\omega_i$ ,  $i = 1, 2, \dots, n$ ,

such that for  $N_n^{(m)}(0) + N_n^{(m+1)}(0)x + \dots + \frac{1}{(r-m)!} N_n^{(r)}(0)x^{r-m} = \frac{r!}{(r-m)!} a_r x^{r-m} + \dots + m! a_m = H_r^{(m)}(x)$ . In fact, by

$N_n^{(s)}(x) = \sum_{i=1}^n c_i \omega_i^s \varphi^{(s)}(\omega_i x + \theta)$ , it is not difficult to obtain that

$$BC = A \tag{2.2}$$

where

$$B = \begin{pmatrix} \varphi^{(m)}(\theta)\omega_1^m & \varphi^{(m)}(\theta)\omega_2^m & \cdots & \varphi^{(m)}(\theta)\omega_n^m \\ \varphi^{(m+1)}(\theta)\omega_1^{m+1} & \varphi^{(m+1)}(\theta)\omega_2^{m+1} & \cdots & \varphi^{(m+1)}(\theta)\omega_n^{m+1} \\ \cdots & \cdots & \cdots & \cdots \\ \varphi^{(r)}(\theta)\omega_1^r & \varphi^{(r)}(\theta)\omega_2^r & \cdots & \varphi^{(r)}(\theta)\omega_n^r \end{pmatrix}, \quad C = (c_1, c_2, \dots, c_n)^T, \quad A = (m!a_m, (m+1)!a_{m+1}, \dots, r!a_r)^T.$$

Now, let  $n = r - m + 1$ , then  $B$  is a square matrix. We choose  $\omega_i = i\delta$ ,  $0 < \delta < 1$ ,  $i = 1, 2, \dots, n$ , thus,  $\omega_i \neq \omega_j$  for  $i \neq j$ . Recalling that  $\varphi^{(s)}(\theta) \neq 0$  gives  $|B| = \varphi^{(m)}(\theta)\varphi^{(m+1)}(\theta)\cdots\varphi^{(r)}(\theta)\omega_1^m\omega_2^m\cdots\omega_n^m \prod_{1 \leq j < i \leq r-m+1} (\omega_i - \omega_j) \neq 0$ , which implies that the Eq.(2.2) has a unique solution:

$$C = B^{-1}A. \tag{2.3}$$

For  $n = r - m + 1, \omega_j = j\delta, j = 1, 2, \dots, n$ , we have

$$B = \begin{pmatrix} \varphi^{(m)}(\theta)\delta^m & 0 & \cdots & 0 \\ 0 & \varphi^{(m+1)}(\theta)\delta^{m+1} & \cdots & 0 \\ \cdots & \cdots & \cdots & \cdots \\ 0 & 0 & \cdots & \varphi^{(r)}(\theta)\delta^r \end{pmatrix} \begin{pmatrix} 1 & 2^m & \cdots & n^m \\ 1 & 2^{m+1} & \cdots & n^{m+1} \\ \cdots & \cdots & \cdots & \cdots \\ 1 & 2^r & \cdots & n^r \end{pmatrix}.$$

Set

$$D = \begin{pmatrix} 1 & 2^m & \cdots & n^m \\ 1 & 2^{m+1} & \cdots & n^{m+1} \\ \cdots & \cdots & \cdots & \cdots \\ 1 & 2^r & \cdots & n^r \end{pmatrix}, \quad E = \begin{pmatrix} 1 & \cdots & 0 \\ \varphi^{(m)}(\theta)\delta^m & \cdots & \cdots \\ \cdots & \ddots & \cdots \\ 0 & \cdots & \frac{1}{\varphi^{(r)}(\theta)\delta^r} \end{pmatrix},$$

then  $B^{-1} = D^{-1}E$ , and  $D^{-1}$  is a known nonsingular square matrix dependent only on  $n, m$  and  $r$ . Let  $M_2$  be the maximum of absolute value of the elements in  $D^{-1}$ , and  $M_3 = \max\{(|\varphi^{(i)}(\theta)|)^{-1}, i = m, m+1, \dots, r\}$ . So, for given  $\theta, r$  and  $m$ , then  $M_2$  and  $M_3$  are the positive constants. By (2.3), we have

$$|c_j| \leq M_2 M_3 \sum_{i=m}^r i! |a_i| \delta^{-i}, \quad j = 1, 2, \dots, n. \tag{2.4}$$

Using Taylor expansion gives  $N_n^{(m)}(x) = N_n^{(m)}(0) + N_n^{(m+1)}(0)x + \dots + \frac{1}{(r-m)!} N_n^{(r)}(0)x^{r-m} + R_r(x)$ , where

$$R_r(x) = \frac{1}{(r-m+1)!} N_n^{(r+1)}(\xi) x^{r-m+1}, \quad \xi \in [a, b]. \text{ Let } |\varphi^{(r+1)}(x)| \leq M_0, \text{ then } R_r(x) \leq \frac{M_1^{r-m+1}}{(r-m+1)!} \sum_{j=1}^n |c_j| j^{r+1} \delta^{r+1} M_0 \leq M\delta,$$

here we used (2.4) and the constant  $M = \frac{M_1^{r-m+1}}{(r-m+1)!} M_2 M_3 M_0 \left( \sum_{i=m}^r i! |a_i| \right) \left( \sum_{j=1}^{r-m+1} j^{r+1} \right)$ . Finally, let  $\delta < \frac{\varepsilon}{M+1}$ ,

then  $|R_r(x)| < \varepsilon$ . The proof of Theorem 2.1 is complete.

### 3 Bernstein-Durrmeyer Operator Defined on Simplex

For description, we introduce some notations used in the sequel. Let  $S$  be a compact subset in  $R^s, s \geq 1$ .

Denote by  $Z_+^s$  the set of all non-negative multi-integers in  $R^s$ . For  $x = (x_1, x_2, \dots, x_s) \in R^s$ , and  $m = (m_1, m_2, \dots, m_s) \in Z_+^s$ , let  $|x| = \sum_{i=1}^s x_i$ ,  $|m| = \sum_{i=1}^s m_i$ ,  $x^m = x_1^{m_1} x_2^{m_2} \dots x_s^{m_s}$ , and  $m! = m_1! m_2! \dots m_s!$ . We say that  $x \leq y$ , where  $x, y \in R^s$ , if  $x_i \leq y_i, 1 \leq i \leq s$ . By  $L^p(S), 1 \leq p < +\infty$ , we denote the space of Lebesgue measurable function on  $S$  for which the norm  $\|f\|_p^p = \int_S |f(u)|^p du$  is finite.  $L^\infty(S) = C(S)$  denotes the space of continuous functions on  $S$  equipped with the maximum norm. For a smooth function  $f$  on  $R^s$ , let  $D^{|m|} f(x)$ ,  $|m| = \sum_{i=1}^s m_i$ , be the  $|m|$ -th order partial derivative of  $f$ . For the compact set  $S$  of  $R^s$ , by  $S_p(S)$ , we mean that there is an open  $\Omega$  (depending on  $f$ ) such that  $S \in \Omega$ , and  $D^{|m|} f \in L^p(\Omega), 1 \leq p \leq +\infty$ . For  $f \in L^p(S), 1 \leq p \leq +\infty$ , the modulus of smoothness of  $f$  is defined by  $\omega(f, \delta)_p = \sup_{0 < h \leq \delta} \|f(\cdot + h) - f(\cdot)\|_p$ . If  $\omega(f, \delta)_p = O(\delta^\alpha)$ ,  $0 < \alpha \leq 1$ , then we say that  $f$  is the Lipschitz functions and write  $f \in Lip(\alpha)$ .

To study the simultaneous approximation of multivariate functions and their derivatives by neural networks in Lebesgue measure, we will use a simultaneous approximation result for the Bernstein-Durrmeyer operator as an intermediate step. Let  $T$  be the simplex in  $R^s$ , the Bernstein-Durrmeyer operator is defined by  $D_n f(x) = \sum_{|k| \leq n} P_{n,k}(x) \Phi_{n,k}(f)$ , where  $P_{n,k}(x) = \frac{n!}{k!(n-|k|)!} x^k (1-|x|)^{n-|k|}$ ,  $\Phi_{n,k}(f) = \frac{(n+s)!}{n!} \int_T P_{n,k}(u) f(u) du$ . The polynomial operator, which was first introduced and studied by Derriennic<sup>[12]</sup> in 1985, is an integral modification of the well-known Bernstein operator. It is also a positive linear bounded operator from  $L^p(T)$  to itself. Here we give a result on simultaneous approximation of the operator in Lebesgue measure, which will be key in the proof of our main result, and its proof is omitted.

**Theorem 3.1.** Suppose  $f \in S_p(T), 1 \leq p \leq \infty$ , and  $D^{|m|} f \in Lip(\alpha), 0 < \alpha \leq 1, m \in Z_+^s, |m| \leq n$ , then

$$\|D^{|m|} D_n f - D^{|m|} f\|_p \leq C n^{-\alpha/2},$$

where and in the following  $C$  denotes a positive constant independent of  $n$  and  $f$ .

### 4 Main Result and Its Proof

In this section, we give and prove the main result of this paper. First, we give some notations that can be found in Section 4 of Ref.[8]. Note that there are  $N_p = C_{p+s-1}^{s-1}$  multi-integers  $i$  in  $Z_+^s$  that satisfy  $i_1 + i_2 + \dots + i_s = p$ , and there are  $I_p = C_{p+s-2}^{s-2}$  multi-integers  $j'$  in  $Z_+^{s-1}$  that satisfy  $j'_1 + j'_2 + \dots + j'_{s-1} = p$ . Clearly  $N_p = N_{p-1} + I_p$ . Denote by  $j'_{N_{p-1+l}}, 1 \leq l \leq I_p$  the multi-integers  $j'$  in  $Z_+^{s-1}$  that satisfy  $j'_1 + j'_2 + \dots + j'_{s-1} = p$ . Hence,  $\{j'_l : 1 \leq l \leq N_p\}$  is a set of multi-integers  $j'$  in  $Z_+^{s-1}$  that satisfy  $j'_1 + j'_2 + \dots + j'_{s-1} \leq p$ . For each  $p$ , let  $i_l^{(p)} = (p - |j'_l|, j'_l), 1 \leq l \leq N_p$ . Hence, each  $i_l^{(p)}$  is a multi-integer in  $Z_+^s$  with  $|i_l^{(p)}| = p, 1 \leq l \leq N_p$ . Define  $p_l = (1, j'_l), 1 \leq l$ , then for each fixed integer  $p \geq 0$ , by setting  $p_l^{(p)} = \frac{1}{2(1+p)} p_l, 1 \leq l \leq N_p$ , we have  $|p_l^{(p)}| \leq 1/2$  for  $1 \leq l \leq N_p$ .

Secondly, we use the expression  $\Phi_{n,k}(f) = \frac{(n+s)!}{n!} \int_T P_{n,k}(u) f(u) du$  in the operator  $D_n f$  to replace the expression  $f\left(\frac{k}{n}\right)$  in the Bernstein operator  $B_n f(x) = \sum_{|k| \leq n} P_{n,k}(x) f\left(\frac{k}{n}\right)$ , then from Proposition 4.1 in Ref.[8] or Theorem 3.1 and Proposition 3.1 in [5], it follows that  $D_n f(x) = \sum_{p=0}^n \sum_{l=1}^{N_p} d_l^{(p)} \langle x \cdot p_l^{(n)} \rangle^p$ , where  $d_l^{(p)}$  are uniquely determined by

$$\begin{pmatrix} (j'_1)^{j'_1} & (j'_2)^{j'_2} & \cdots & (j'_{N_p})^{j'_1} \\ \vdots & \vdots & \vdots & \vdots \\ (j'_1)^{j'_{N_p}} & (j'_2)^{j'_{N_p}} & \cdots & (j'_{N_p})^{j'_{N_p}} \end{pmatrix} \begin{pmatrix} d_1^{(p)} \\ \vdots \\ d_{N_p}^{(p)} \end{pmatrix} = \frac{(2(1+n))^p}{p!} \begin{pmatrix} i_1^{(p)} 1_{C_{N_p}^{(p)}}(f) \\ \vdots \\ i_{N_p}^{(p)} 1_{C_{N_p}^{(p)}}(f) \end{pmatrix} \quad (4.1)$$

with  $c_l^{(p)}(f) = \frac{n!}{(n-p)!} \sum_{q \leq i_l^{(p)}} \Phi_n, q(f) \frac{(-1)^{|i_l^{(p)}-q|}}{q!(i_l^{(p)}-q)!}$ ,  $1 \leq l \leq N_p$ .

Our main result can now be stated as follows.

**Theorem 4.1.** Let  $S$  be a compact subset of  $R^s$ ,  $s \geq 1$ . Also, let  $\varphi \in C(R)$ ,  $\varphi^{(|m|+1)} \in C(R)$ ,  $\varphi^{(i)}$  bounded on  $R$ , and there exists a  $\theta \in R$  such that  $\varphi^{(i)}(\theta) \neq 0$  for  $1 \leq i \leq |m|+1, m \in Z_+$ . Then for any  $f \in S_p(S)$  and  $D^{|m|}f \in Lip(\alpha)$ ,  $0 < \alpha \leq 1$ , there is a neural network  $N(x)$  with one hidden layer,  $(n+1)(n-|m|+1)$  units in the hidden layer and activation function  $\varphi$ , such that  $\|D^{|m|}N - D^{|m|}f\|_p \leq Cn^{-\alpha/2}$ ,  $|m| \leq n$ .

Now we prove Theorem 4.1. By the discussion in Section 2 of Ref.[8], it is sufficient to prove Theorem 4.1 in the case  $S = T$ . Let  $L = \sum_{p=0}^n \sum_{l=1}^{N_p} |d_l^{(p)}|$ . According to Theorem 2.1, for  $H_r(x) = a_0 + a_1x + \dots + a_r x^r$ , there is  $N(x) = \sum_{i=1}^{r-m+1} c_i \varphi(\omega_i x + \theta)$ ,  $c_i, \omega_i \in R$ , such that for  $j$ ,  $0 \leq j \leq r$ , and  $\forall \varepsilon > 0$ ,  $\|N^{(m)} - H_r^{(m)}\|_p < \varepsilon$ . Set  $N(x) = \sum_{p=0}^n \sum_{l=1}^{N_p} d_l^{(p)} \sum_{i=1}^{n-|m|+1} a_{p,i} \varphi(b_{p,i} \langle x \cdot p_l^{(n)} \rangle + \theta)$ , then this is a neural network with one hidden layer, and its number of units in hidden layer is  $(n+1)(n-|m|+1)$ . Set  $x \cdot p_l^{(n)} = u$ , then  $\langle x \cdot p_l^{(n)} \rangle^p$  can be written as a polynomial of  $n$  degree. By noting that  $|\langle x \cdot p_l^{(n)} \rangle| \leq 1$  for  $x \in T$ ,  $|p_l^{(n)}| \leq 1/2$ , and setting  $\varepsilon = n^{-\alpha/2}$ ,  $0 < \alpha \leq 1$ , it follows from Theorem 3.1 and Eq.(4.1) that  $\|D^{|m|}N - D^{|m|}f\|_p \leq \|D^{|m|}N - D^{|m|}D_n f\|_p + \|D^{|m|}D_n - D^{|m|}f\|_p \leq Cn^{-\alpha/2}$ . This completes the proof of Theorem 4.1.

## 2004年全国理论计算机科学学术年会

### 征文通知

由中国计算机学会理论计算机科学专业委员会主办,海军工程大学信息与电气学院承办的“2004年全国理论计算机科学学术年会”将于2004年10月在武汉召开。会议录用论文将收录在正式出版的论文集中,欢迎大家积极投稿。现将有关征文要求通知如下:

1. 应征论文应未在其他刊物或学术会议上正式发表过。特别欢迎有创见的论文和有应用前景的论文。

2. 稿件要求用计算机打印,格式为38行×38字,字体为5号宋体。稿件中的图形要求画得工整、清晰、紧凑,尺寸要尽量小;图中字体要求为六号宋体。稿件正文不超过六千字。标题、作者姓名、作者单位、摘要、关键词采用中英文间隔行文。稿件各部分依次为:一、引言;二、...;最后是结束语。附录放在参考文献之后;参考文献限已公开发表的,文中最好不要出现文献序号。参考文献的格式为:

序号 作者·书名·出版社所在地:出版社名,出版年代

序号 作者·论文名·出处,年代·卷号(期号):起迄页码

务必附上第一作者简历(姓名、性别、出生年月、职称、学位、研究方向等)、通信地址和联系电话。并注明论文所属领域。请提供打印稿和电子稿各一份。来稿一律不退,请自留底稿。

#### 3. 征文范围

程序理论(程序逻辑、程序正确性验证、形式开发方法等);计算理论(算法设计与分析、复杂性理论、可计算性理论等);语言理论(形式语言理论、自动机理论、形式语义学、计算语言学等);人工智能(知识工程、机器学习、模式识别、机器人等);逻辑基础(数理逻辑、多值逻辑、模糊逻辑、模态逻辑、直觉主义逻辑、组合逻辑等);数据理论(演绎数据库、关系数据库、面向对象数据库等);计算机数学(符号计算、数学定理证明、计算几何等);并行算法(分布式并行算法、大规模并行算法、演化算法等)。

4. 征文截止日期:2004年5月1日

5. 论文投寄地址:(430033)武汉 海军工程大学信息与电气学院 张志祥 收

联系电话:027-83443985,83443984(张志祥,贲可荣)
